

# AVENUE

Autonomous  
Vehicles to  
Evolve to a  
New Urban  
Experience

[www.h2020-avenue.eu](http://www.h2020-avenue.eu)

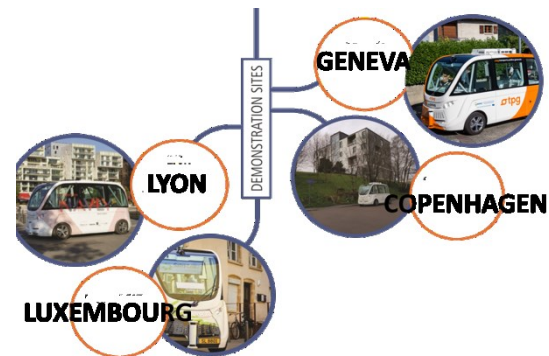

## From demonstrator to public transportation service

Prof. Dimitri Konstantas

*AVENUE project coordinator*

This project has received funding from the European Union's Horizon 2020 research and innovation program under grant agreement No. 769033.

*A 4 year's project with mission to :*

*Prepare the adoption and deployment of  
Autonomous vehicles for public transportation.*

*To seek out **new transport paradigms** and  
new business models.*

*To boldly test **disruptive public transport  
services** which no autonomous vehicle has  
done before!*

**4 year project**

**16 Partners – 4 sites**

**20 MEUR budget**

**15.4MEUR EU Contr.**

**May 1<sup>st</sup>, 2018 – April 30, 2022**

# AVENUE 4 primary validation sites

(open street, mixed traffic, with regular public service)

## ■ Geneva – TPG

Sept. 2018 – December 2020 Meyrin : regular service, 2 AVs

Since Sept. 2020 - Bell-Idée

On-demand, door-to-door, fleet of 3 AVs (opens to public in January 2021)

## ■ Lyon – Keolis

Since May 2018 – regular service at Confluence – 2 AVs

Since November 2019 - Parc Olympique Lyonnais stadium

Complex roads, hi-speed traffic, V2X – 2 AVs, Line N1

## ■ Luxembourg – Sales-Lentz

Since September 2018 – Pfaffenthal - 2 AVs

Since Summer 2020 - Contern

Complex road, link to train services, on-demand – 2 AVs

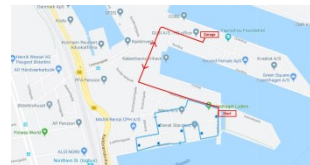

## ■ Copenhagen – Holo

May 2018 – Oslo, Gothenburg - 3 AVs

Fall 2020 – Nordhaven

On-demand – 2 to 4 AVs, fixed route

# What is our target in AVENUE

Deploy Autonomous/Automated (SAE level 4) Vehicles for regular **commercial public transportation** services.

*On-demand, Door-to-door public transportation service*

We are **NOT** targeting a “simple” fixed route, on-demand bus-stop service.

We are **NOT** targeting a test deployment **BUT** a full regular, commercial service

We are **NOT** targeting a operator based vehicle, **BUT** a service with no operator intervention.

# Deploying the real power of AVs in public transportation

## The Geneva Belle-Idee site

A 36 hectares site with mixed traffic and population

- Patients, school kids, professionals
- Hospital, commercial area, school
- Cars, bicycles, pedestrians, patients

*Today it is served with a bus line traversing the site*

*Transfers between buildings is done using the private cars*

# Full autonomous busses deployment

- Suppression of the bus line
- Transfer between buildings using Autonomous vehicles
  - 69 virtual bus-stops
  - All roads are covered
- Target : Busses operating 24/24
  - Inductive charging
  - Automated exit from hangar
- Operating today with no passengers
- Opening to public in January 2021

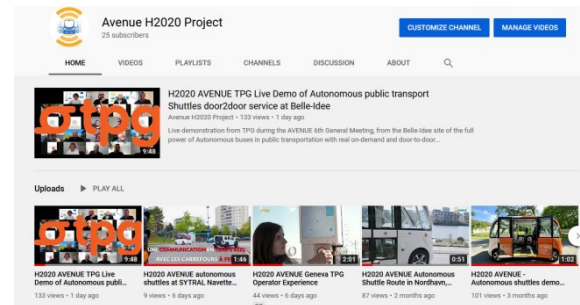

# The Belle-Idee site (Geneva)

On-demand – door-to-door services

- On demand, door to door travel
  - No predefined routing, no predefined bus stops (with stop point exclusions), within a specific urban area, immediate or deferred
- Intelligent planner
  - Propose optimal travel planning, with traditional service coordination based on passenger personal needs and capabilities
- In-vehicle services
  - “follow your kid”
  - passenger security

Different videos are available at our YouTube channel

<https://www.youtube.com/channel/UCbJkeigrQ-L7tSucSgpQWFWQ>

# Barriers and obstacles

**The road for Deploying Autonomous vehicles for commercial, regular public transportation is filled with obstacles ....**

- Legal Barriers
- Technical shortcomings
- Transport Model changes
- Business models
- Passenger services

## Setting up a demonstrator

Not a trivial situation ... time consuming ...

- Getting the required authorizations to operate in open roads (national, local ...)
- Certifying the buses
- Mapping the area, setting up the itinerary ..

**Not a commercial service, more a “tourist” attraction**

## Getting a license for Public Transportation service

Starts becoming more complex :

Public transportation services are governed by an additional set of laws:

Vehicle standards to serve special needs passengers

- blind, handicapped access

Infrastructure obligations

- bus stop shelters, road signaling ...

# Deploying Public Transportation services with the full power of Autonomous Vehicles

- Door-to-door shared public transportation services,
- On-demand operation

***No-bus stops, no fixed itineraries, no time schedules, no intervention by the safety operator ...***

***Legal framework not adapted ..***

***This service cannot really exist !!!***

## Final step : removing the safety operator

Not yet possible for accredited public transportation services on open roads !!!!

# Lessons learned : 1

## 1. Do not underestimate the effort to obtain certifications

- Vehicle & itinerary homologation
  - Long and costly process specific to each country
  - Authority fragmentation in EU countries
  - Vehicle certification
  - Test site certification
- Procedure can take
  - From 1 to 3 years
  - From 100.000 EUR to 600.000 EUR

# Some examples of the the Contents of the application !!

## Denmark

## Lessons learned : 2

### 2. Beware of Technical incompatibilities and shortcomings

- There are no standards for the APIs of AVs
  - Linking fleet orchestration system to a vehicle has many surprises !!
- GNSS/4G availability and coverage
  - Shadow areas in the city

# Who controls the vehicle itinerary?

- The fleet orchestration service and AV operation is not always compatible
  - Fleet orchestration organizes the vehicle dispatching, given the passenger requests
  - AV is designed to go optimally from A to B
- It took us a year to align the 2 systems, with changes in both systems

# GNSS/4G issues

AVs require centimetric localisation accuracy

- GNSS and 4G shadow areas exist in many places in an urban environment
- Visual driving
  - Not the main model of all AVs
- Own GNSS antennas – cannot install 4G antennas!

## Lessons learned : 3

### 3. Convince authorities for new Public Transport Models

- Public transportation = fixed bus routes and fixed bus stops
  - From fixed bus stops to anyplace
    - Bus stop infrastructure?? (legal requirements)
- From large busses to fleet of small buses
  - Parallel service vs sequential

# Policy and legal issues

**Luxembourg** : authorities do not want public bus reservations with mobile apps, nor buses without fixed itineraries.

**Copenhagen**: open road itinerary certification is so complex and costly that makes it prohibitive ask for any minor change.

**Geneva**: authorities provide authorisations for innovative services (some bureaucracy, but not major obstacles)

**Lyon** : ready to authorise innovative services (some bureaucracy, but not major obstacles)

“They shouldn’t allow humans to drive!”

# Policy and legal issues

Public transportation laws define that each bus stop must have an infrastructure.

On-demand, door-to-door services means that the bus can stop everywhere...

- Cannot really install infrastructures everywhere

Do the authorities allow a bus stop without infrastructure?

- Large interpretation of the law ....

## Lessons learned : 4

### 4. Be careful of silent assumptions

Public transportation *service quality* depends for big part on the driver.

Full power AVs means operation without “driver” (safety operator).

***Who offers the formal and informal services of a (non-existent now) bus driver?***

## Services offered by the driver

- Replying to passenger questions
- Assisting passengers to enter/exit to buss
- Ensuring the safety in the bus (aggressions, vandalism, lost objects ...)
- Controlling the status of the bus (cleanness)
- Copes with incidents (accidents, mechanical failures ..)

**Before you are able to offer a public transportation service, you must provide solutions for the driver services.**

# Some services provided in AVENUE

- “follow your kid” – identify a specific passenger (face recognition) and send a stream to the parent
- Passenger security – identify aggressions in the bus
- Vehicle safety – identify vandalism, littering, Forgotten objects
- Provide information to the passengers in-vehicle
- Buss-stop information points, on-line information points
- Buss identification – signaling the bus number to the waiting passenger
- Signaling to the mobile app next stop to exit – link with in-vehicle anonymous announcement

## Lessons learned : 5

### 5. Not easy to create a Business model

Not yet clear how the business model can be profitable

- Driver costs – intervention team costs
- What is the critical mass of vehicles operating?
- Required technical infrastructure cost
- Ecological operation
  - Minimum 3 passengers
    - Impact to service quality?
- Vehicle life time – 6 years !!!
- Micro or macro economic model?

# Loss of interest

Operators and municipalities are interested in the use of AVs, BUT the

- lack of profitable business opportunities
- low technology maturity
- lack of clear operation models and transport services
- High CAPEX and OPEX costs

Very hesitant to invest and adopt for public transport services

# Thank you!!
